"Screening for mutations of the apolipoprotein B gene causing hypocholesterolemia.";
Hum. Genet. 102.44-49(1998).
-!- FUNCTION: Apolipoprotein B is a major protein constituent of cylomicrons (apo B-10). LDL (apo B-10) and VLDL (apo B-100). App B-100 functions as a recognition signal for the cellular binding and internalization of LDL particles by the apoB/E receptor.

Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing atherosclerosis.

Claim 17; Page 57; 70pp; English.

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358 to 3367 of apoB100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent atherosclerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used as an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can

receptor mutations. They were created to identify compounds which modulate atheroaclerosis. The peptides are derived from amino acids 3358 to 3367 of apo8100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent atherosclerosis. The transgenic non-human animals and mammals which atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can study of atherosclerosis, and in vivo assay methods for identifying compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the connection of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                                                                 ö
also be used to identify compounds which result in an increase in atherosclerotic regions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-lease and tends to additive apo sequence, which is large and tends to aggregate, to provide binding
                                                                                                                                                                                                                                                                                     Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo B100 receptor site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a nonnaturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KABTKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                    Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo B100 receptor site.
                                                                                                                                                                                                                                                                                                                                                                                             Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.

This sequence is an example of the peptide of the invention. It has the formula (I), or their variants with one or more internal deletions, insertions or substitutions, while retaining anti-coagulant properties of apolipoprotein B-100 (apob-100). ILYAQ-XI-KAKARRHS-X2-T-Z2 (I) XI = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-47 amino acids (as); Z2 = the C terminus of the peptide, a terminal amide group or 1-77 as. Compositions containing the peptide are used for simultaneous, separate or sequential treatment of cancer, particularly to prevent captactic spread. They are also used to inhibit thromboplastin-mediated processes, specifically to prevent or reduce blood coagulation (e.g. during or after surgery or in cases of heart attack, stroke etc.) and to which is active as such or as part of a 98-as apptide, inhibits of the prothrombinase complex; and prevents activation of the prothrombinase complex; and prevents activation of the residues Se defort thromboplastin and of platelets by thrombin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

```
which comprises a peptide having at least one sulphated or sulphonated charged and at least one amino acid chosen from neutral and positively charged amino acids. The novel ligands can be used for the treatment of e.g. tumours, rheumatoid arthritis, diabetic retinopathy and hypoxia. This sequence represents a heparin binding peptide relating to the
                                                                                                                                                                                                                                                                             The invention relates to a novel ligand for binding a target biomolecule,
                                                                                                                                                                 Use of a ligand comprising of at least one sulfated or sulfonated amino acid for the treatment of e.g. tumors, rheumatoid arthritis, diabetic retinopathy and hypoxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo B100 receptor site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human apolipoprotein B-100 (app8-100). Apo8-100 is a major approtein component of very-low density lipoproteins (VLDL), intermediate density lipoproteins (LDL), and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arteriosclerosis
apolipoprotein; binding; in vivo transport; nucleic acid; binding domain; nuclear localisation sequence; gene therapy; cancer; cystic fibrosis; non-small cell lung carcinoma; diabetes; arteriosclerosis.

The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a nonnaturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KARYKKNKHR (1) or TTRLTRKRGLK (2), or their clamers. Non-naturally occurring, receptor-competent LDL particles are useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives cocurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo 8100 receptor site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAW57209
```

8 g The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL)

```
ò
particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to peptides having affinity for oxidised low density lipoprotein (oxLDL), in cyclised or multimeric form. The peptide is useful in an immunoassay to determine the presence, and optionally, the amount of antibodies in a sample, having affinity for oxLDL. Preferably immobilised peptide is useful for measuring the amount of autoantibodies for oxLDL. In a sample, especially a serum or plasma sample from a patient for evaluating the risk of coronary heart diseases, other periaortitis, pre-eclampsia, non-insulin-dependent diabetes and endothelial dysfunction. The peptide of the invention is stable, can be synthesised easily without the need to isolate proteins from a patient's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptide useful in enzyme immunoassays for detecting oxidized low density lipoprotein which is a marker of coronary heart disease and other cardiovascular diseases, has affinity for oxidized low density
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oxidised low density lipoprotein; oxLDL; immunoassay; periaortitis; cardiovascular disease; coronary heart disease; pre-eclampsia; non-insulin-dependent diabetes; endothelial dysfunction; human; apoB-100;

(associated with hypercysteinaemia and venous thrombosis) and factor VII mutations (associated with increased risk of cardiovascular disease). The method can also be applied to proteins from pathogens, e.g. viruses or prions. The method does not require complex apparatus for polymerase chain reactions, it is simple, standardisable and reliable and is particularly suited to routine screening. It also allows mutant protein in a sample to be quantified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW64587 and AAW64588 are fragments of human apolipoprotein which are used with Factor V protein fragments in a novel method too detect the presence of a mutated protein in a sample that may also contain the corresponding wild-type protein. The method is used to detect mutations that alter protein functions (either point mutation or small insertions or deletions), particularly in proteins involved in blood coagulation or metabolism of fat. Protein functions which are specially detectable are the Leyden mutation in factor V (associated with increased risk of deep vaint thrombosis), mutations in apolipoprotein (apo) genes (certain alleles of apoE indicates increased risk of developing Alzheimer's disease), thermostable 5,10-methylenetetrahydrofolate reductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting or quantifying mutant protein in presence of wild-type protein comprises reaction with ligand - used to detect mutant blood coagulation factors or apolipoproteins for diagnosing risk of thrombosis.
                                                                                                                                                                                                                                                                                       Factor V; human; detection; protein function; blood coagulation; apo; fat metabolism; Leyden mutation; deep vein thrombosis; apolipoprotein; Alzheimer's disease; 5,10-methylenetetrahydrofolate reductase; prion; hypercysteinaemia; factor VII; cardiovascular disease; pathogen; virus.

ApoB-100 is a major approtein component of very-low density lipoproteins (VLDL), intermediate density lipoproteins (VLDL), intermediate density lipoproteins (state) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition to the invention. The apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in viro. for expressing a therapeutic polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                             AAW96827-77 represent nucleic acid binding domains derived from human apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoproteins (LDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia;

(MOLE-) MOLECULAR DYNAMICS INC.

Chen W, Rank DR; Hanzel DK,

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.

Claim 27; SEQ ID NO 31152; 658pp; English.

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. comprising one of 13109 defined nucleotide sequences given in the specification (or complements / fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipideamia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from WIPO at the printed specification ftp.wipo.int/pub/published_pct_sequence

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Aymolecule type: protein

By Blackhart, B.D; Ludwig, E.M; Pierotti, V.R.; Caiati, L.; Onasch, M.A.; Wallis, S.C.;

J. Biol. Chem. 261, 15364-15367, 1986

AyTitle: Structure of the human apolipoprotein B gene.

Aymoner: annotation; gene structure

By Biol. Chem. Hoppe-Seyler 368, 419-425, 1987

AyTitle: Studies on the organization of the human apolipoprotein B 100 gene.

Aymonent: annotation; gene structure

Aymolecule type: Aymolecule By Biol.

Aymolecule: Apolis; Wuld. 1987

Aymolecule: annotation; gene structure

By Weisgraber, K.H.; Rall Jr., S.C.

J. Biol. Chem. 262, 11097-11103, 1987

Aymolecule: annotation; protein B-100 heparin-binding sites.

Aymolecule: annotation; heparin binding and disulfide bond

Aymolecule: Apolipoprotein B is a calcium binding protein.

Aymolecule: annotation; calcium binding protein.

Aymolecule: annotation; calcium binding protein.

Aymolecule: Apolipoprotein B is a calcium binding protein.

Aymolecule: Apolipoprotein B is a calcium binding protein.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Apiecenle annotation; calcium binding Bymolecule Apiecenle annotation; calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is a calcium binding Bymolecule Brobhys.

Aymolecule: Apolipoprotein B is Bymolecule Brobhys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A; Molecule type: mRNA
A; Residues: 2169-2179 <hOspin the sequence shown to the sequence shown the sequence shown to the sequence shown to the sequence shown the sequence the 250K apo8-48, CAA encoding 2180-Gln is substituted by the stop codon TAA, Ry Yang, C.; Kim, T.W.; Weng, S.; Lee, B.; Yang, M.; Gotto Jr., A.M.

-1- FUNCTION: Apolipoprotein B is a major protein constituent of
chlomicrons (apo B-48), LDL (apo B-100) and VLDL (apo B-100). Ap
B-100 functions as a recognition signal for the cellular binding
and internalization of LDL particles by the apoB/E receptor.
-1- SUBCELLULAR LOCATION: Secreted.

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which amoulate atheroselerosis. The peptides are derived from amino acids 3358 to 3367 of apollo. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-FG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atheroselerotic lesions and prevent atheroselerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used as an in vivo model system for the study of atheroselerosis, and in vivo assay methods for identifying compounds which modulate atheroselerosis and/or LDL-PG binding. They can

AAY30582-Y30700 represent apo-Bl00 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358 to 3367 of apoBl00. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent atherosclerosis. The transpance on invivo model system for the etudy of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in atherosclerotic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the conmation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                                               ;

AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which receptor mutations. They were created to identify compounds which compared to a 3367 of apoB100. The method comprises detecting compounds which affect can be used for identifying compounds which farupt LDL-PG binding with proteoglycan (PG). The method can be used for identifying compounds which farupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent atherosclerosis. The transgenic non-human animals and manmals which carpounds which modulate atherosclerosis, and in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which result in an increase in a therosclerostic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the contact of a datherosclerostic lesions. The polymucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosts in an animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                        Apo-B100; proteoglycan receptor mutation; atherosclerosis;
low density lipoprotein; proteoglycan; LDL; atherosclerotic lesion.
                                                                                                                                                                                                                                                                                                            Apo-B100 derived peptide showing a proteoglycan receptor mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 17; Page 57; 70pp; English.

The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the experisitation (available on a computer readable formath, or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the expressed from 2469 of 2489 identified DNA coding regions from the expressed from 2469 of 2489 identified DNA coding regions from the sequence of ABS5649. Also included are an antibody which binds one of the protein. treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 81-100 of a caquence contained within a Streptococcus nucleic acid sequence. The first primer is substantially complementary to the target sequence of the first primer is substantially complementary to the carget sequence contained within a Streptococcus nucleic acid sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes caid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus cand and antibiotics. The methods are useful for identifying media or ear infection. They are also useful in developing vectines, diagnostics and antibiotics. The methods are useful for identifying expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed sequence. Note: The sequence data for this patent did not form part of the printed protein and proteins or the present sequence is one of the 2469 proteins are defined by the identified coding regions from the genomic sequence.
                                                                                                                                                                                                                                                                                                                                                                                                          New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or
 Bacterial meningitis; pneumonia; sepsis; otitis media; ear infection; antinflammatory; antibacterial; immunostimulant; auditory; respiratory;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance, useful for conferring resistance or tolerance to a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             substantially the same activity as the full-length polypeptide. The plypoptocitie of the invention is useful for conferring resistance or tolerance to a plant pathogen. The present sequence represents a protein conferring disease resistance used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel isolated polynucleotide comprising a plant nucleotide sequence having an open reading frame that encodes a polypeptide associated with disease resistance or its fragment having

This represents a S. pneumoniae priA polypeptide. The priA polypeptides and polynucleotides are useful for the treatment of microbial diseases (especially in the form of vaccines) and the methods are useful for identifying agonists and antagonists. The polypeptides are also useful for relating to diagnostic assays for detecting diseases associated with microbial infections (especially infections by Streptococcus pneumoniae) and conditions associated with such infections and assays for detecting priA expression or activity. The polypeptides are useful in the discovery and development of antibacterial compounds. The encoded protein upon expression can be used as a target for screening of antibacterial drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated Streptococcus pneumoniae nucleic acids and polypeptides. The nucleic acids and proteins are useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, such as S. pneumoniae infection. These may also be used for drug screening procedures. The present sequence represents a Streptococcus pneumoniae polypeptide of the invention. Note: The sequence data for this patent did not appear in the printed specification but was sequence uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecules and polypeptides useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, e.g. Streptococcus pneumoniae infection, and in drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       priA polypeptide, microbial disease, vaccine, microbial infection, Streptococcus pneumoniae, antibacterial.

                                                                                                AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which acceptor mutations. They were created to identify compounds which acceptor modulate atheroselerosels. The peptides are derived from amino acids 3358 to 3367 of apo8100. The method comports see detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent catherosclerosis. The transgenic non-human animals and mammals which express human apo-B100 can be used an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in a particular food or drug composition tends to stimulate or inhibit the formation of atherosclerotic lesions. The polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAY30582-Y30700 represent apo-B100 derived peptides showing proteoglycan receptor mutations. They were created to identify compounds which modulate atherosclerosis. The peptides are derived from amino acids 3358
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying compounds which affect binding of low density lipoprotein with proteoglycan, used for, e.g. obtaining compounds for reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Apo-B100; proteoglycan receptor mutation; atherosclerosis;
low density lipoprotein; proteoglycan; LDL; atherosclerotic lesion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Apo-B100 derived peptide showing a proteoglycan receptor mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

to 3367 of apoB100. The method comprises detecting compounds which affect low density lipoprotein (LDL) binding with proteoglycan (PG). The method can be used for identifying compounds which disrupt LDL-PG binding without inhibiting LDL receptor binding. Such compounds can be used to reduce or prevent the formation of atherosclerotic lesions and prevent express human apo-B100 can be used as an in vivo model system for the study of atherosclerosis, and in vivo assay methods for identifying compounds which modulate atherosclerosis and/or LDL-PG binding. They can also be used to identify compounds which result in an increase in a therosclerotic regions. Thus the assays may be used to determine whether a particular food or drug composition tends to stimulate or inhibit the compact of a particular food or drug composition tends to stimulate or inhibit the compact of the properties of the polynucleotides can also be used in gene therapy for preventing or reducing the severity of atherosclerosis in an animal or mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences KAEKKKNKHH (1) or TTRITREGEK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo B100 receptor site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.

This sequence is an example of the peptide of the invention. It has the formula (1), or their variants with one or more internal deletions, insertions or substitutions, while retaining anti-coagulant properties of apolipoprotein B-100 (apoB-100). Z1-KAQ-X1-KKNKHRHS-X2-T-Z2 (1) X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-47 amino acids as . Z2 = the C terminus of the peptide, a terminal amide group or 1-77 as . Compositions containing the peptide are used for simultaneous, separate or sequential treatment of cancer, particularly to prevent metastatic spread. They are also used to inhibit thromboplastin-mediated processes, specifically to prevent or reduce blood coagulation (e.g. during or after surgery or in cases of heart attack, stroke etc.) and to inhibit amgiogenesis, cellular differentiation or apoptosis. KRAD-14, which is active as such or as part of a 98-aa peptide, inhibits activation of the prothrombinase complex; and prevents activation of factor VII on the surface of thromboplastin and of platelets by thrombin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide fragments of apo:lipo:protein B-100 with anticoagulant activity used for treating or preventing coagulation, inhibiting angiogenesis, cell differentiation and apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anti-coagulant; apolipoprotein B-100; apoB-100; metastatic spread; thromboplastin-mediated process; cancer; inhibitor; blood coagulation; angiogenesis; cellular differentiation; apoptosis; KRAD-14;

                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 10% identity with sequences: KABYKKNKHRH (1) or TTRLTRKRGLK (2), or thair dimentially accorded to the competent LDL particles are useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally cocurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor.

The invention relates to a novel ligand for binding a target biomolecule, which comprises a peptide having at least one sulphated or sulphonated amino acid and at least one amino acid chosen from neutral and positively charged amino acids. The novel ligands can be used for the treatment of e.g. tumours, rheumaticid arthritis, diabetic retinopathy and hypoxia. This sequence represents a heparin binding peptide relating to the
                                                                                                                    Cytostatic; antirheumatic; antiarthritic; antidiabetic; ophthalmological; cardiovascular; circulatory; ligand; sulphated; sulphonated; tumour; rheumatoid arthritis; hypoxia; diabetic retinopathy; heparin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of a ligand comprising of at least one sulfated or sulfonated amino acid for the treatment of e.g. tumors, rheumatoid arthritis, diabetic retinopathy and hypoxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo B100 receptor site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAW96878-97 represent nuclear localisation signal sequence derived from human apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoproteins (LDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutic polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human apolipoprotein B-100; apoB-100; very-low density lipoprotein; VLDL; apollipoprotein; binding; in vivo transport; nucleic acid; binding domain; nuclear localisation sequence; gene therapy; cancer; cystic fibrosis; non-small cell lung carcinoma; diabetes; arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Composition comprising nucleic acid bound to LDL or VLDL lipoprotein - used for delivering nucleic acid to cells for gene therapy and antisense

Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.

Claim 13; Fig 7; 73pp; English.

The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a nonnaturing, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein creceptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 7 of identity with sequences: KABTKKNKHRH (1) or TTRLTRKRGIK (2), or their clienty with sequences: KABTKKNKHRH (1) or TTRLTRKRGIK (2), or their custul as: (1) drug-targeting vectors for delivering anticancer drugs to useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives coruring, receptor-competent LDL particles are considered apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor
